Dec '15

Hello, I need to know the route to modify this section (registration).

This is the url: <http://revistabarataria.es/web/index.php/rb/user/register> ⁴⁴

Thank you!

The URL is formed as base_url / index.php / journalShortname / routingPath.

The routingPath corresponds to a page handler in the framework. For example, user/register is:

 github.com ³

[pkp/ojs/blob/ojs-dev-2_4/pages/user/index.php#L33](#)

```
23 |         case 'profile':
24 |             case 'saveProfile':
25 |             case 'changePassword':
26 |             case 'savePassword':
27 |                 define('HANDLER_CLASS', 'ProfileHandler');
28 |                 import('pages.user.ProfileHandler');
29 |                 break;
30 |             //
31 |             // Registration
32 |             //
33 |             case 'register':
34 |             case 'registerUser':
35 |             case 'activateUser':
36 |                 define('HANDLER_CLASS', 'RegistrationHandler');
37 |                 import('pages.user.RegistrationHandler');
38 |                 break;
39 |             //
40 |             // Email
41 |             //
42 |             case 'email':
43 |                 define('HANDLER_CLASS', 'EmailHandler');
```

So, then we look at RegistrationHandler.inc.php:

 github.com ¹⁰

[pkp/ojs/blob/ojs-dev-2_4/pages/user/RegistrationHandler.inc.php#L31-L60](#)

```
31 | function register($args, &$request) {
32 |     $this->validate($request);
33 |     $this->setupTemplate($request, true);
34 |
35 |     $journal =& $request->getJournal();
36 |     //
37 |     if ($journal != null) {
38 |         import('classes.user.form.RegistrationForm');
39 |
40 |         $regForm = new RegistrationForm();
41 |         if ($regForm->isLocaleResubmit()) {
42 |             $regForm->readInputData();
43 |         } else {
44 |             $regForm->initData();
45 |         }
46 |         $regForm->display();
47 |
48 |     } else {
49 |         $journalDao =& DAORegistry::getDAO('JournalDAO');
50 |         $journals =& $journalDao->getJournals(true);
```

This file has been truncated. [show original](#)

Note that this imports a form via `import('classes.user.form.RegistrationForm')`, so you'll find a lot of the code there:

 github.com ¹⁴

[pkp/ojs/blob/ojs-dev-2_4/classes/user/form/RegistrationForm.inc.php](#)

```
<?php

/**
 * @defgroup user_form
 */

/**
 * @file classes/user/form/RegistrationForm.inc.php
 *
 * Copyright (c) 2013-2017 Simon Fraser University
 * Copyright (c) 2003-2016 John Willinsky
 * Distributed under the GNU GPL v2. For full terms see the file docs/COPYING.
 *
 * @class RegistrationForm
 * @ingroup user_form
 *
 * @brief Form for user registration.
 */

import('lib.pkp.classes.form.Form');
```

This file has been truncated. [show original](#)

You'll find the templates here:

 GitHub ⁸

PKP

pkp/ojs

PUBLIC KNOWLEDGE PROJECT

ojs - Open Journal Systems

For example, the display of the template (`$templateMgr->display('user/registerSite.tpl')`) calls:

 github.com ¹⁶

[pkp/ojs/blob/ojs-dev-2_4/templates/user/registerSite.tpl](#)

```
{**
 * templates/user/registerSite.tpl
 *
 * Copyright (c) 2013-2017 Simon Fraser University
 * Copyright (c) 2003-2016 John Willinsky
 * Distributed under the GNU GPL v2. For full terms see the file docs/COPYING.
 *
 * Site registration.
 *}
{strip}
{assign var="pageTitle" value="user.register"}
{include file="common/header.tpl"}
{/strip}
<div id="journals">
{iterate from=journals item=journal}
    {if !$notFirstJournal}
        {translate key="user.register.selectJournal":
        <ul>
        {assign var=notFirstJournal value=1}
```

This file has been truncated. [show original](#)

If you just want to change the text, this can be done by using the Translator plugin or Custom Locale plugin. Both are Generic plugins.

User Home -> Journal Manager -> System Plugins -> Generic Plugins

The Translator plugin will operate on the Site level, the Custom Locale plugin on the Journal level.

The locale file is: locale / localeName / locale.xml and the key is "user.orcid.description".
